### CASO CLÍNICO TIPO EUNACOM

#### ESCENARIO CLÍNICO TÍPICO:

"Una profesora de cuarenta años consulta por disfonía de tres meses. La nasofibrolaringoscopia muestra dos lesiones simétricas en el borde libre de ambas cuerdas vocales. No fuma. ¿Cuál es el diagnóstico y el tratamiento inicial?"

#### EXPLICACIÓN CLÍNICA DETALLADA:

Manejo clínico y diagnóstico según normativa MINSAL y perfil EUNACOM para Disfonías Crónicas. Priorizar reconocimiento precoz y tratamiento de primera línea.

**PUNTOS CLAVE DESTACADOS**

- Disfonía crónica: más de dos a tres semanas; estudio siempre con nasofibrolaringoscopia
- Nódulos vocales: pares, simétricos, por abuso vocal; tratamiento inicial: fonoterapia
- Pólipos y quistes vocales: unilaterales; requieren cirugía
- Edema de Reinke: fumadores crónicos; voz grave o masculinizada en mujeres; tratamiento: dejar de fumar más cirugía
- Parálisis vocal unilateral: disfonía y voz bitonal; causa frecuente: daño intraoperatorio del nervio laríngeo recurrente izquierdo
- Parálisis vocal bilateral: estridor y obstrucción de vía aérea; emergencia
- Papilomatosis laríngea por VPH 6 y 11: vegetaciones en laringe, altamente recidivante, tratamiento con láser repetido

**EVALUACIÓN DE CLASE Y PREGUNTAS TIPO EUNACOM (DISFONÍAS CRÓNICAS)****PREGUNTA 1**

Una profesora de cuarenta años consulta por disfonía de tres meses. La nasofibrolaringoscopia muestra dos lesiones simétricas en el borde libre de ambas cuerdas vocales. No fuma. ¿Cuál es el diagnóstico y el tratamiento inicial?

- A)** Pólipos vocales bilaterales; indicar cirugía de extirpación
- B)** Nódulos vocales por abuso vocal; indicar fonoterapia como primera línea
- C)** Cáncer glótico bilateral; biopsia urgente
- D)** Edema de Reinke bilateral; indicar dejar de fumar
- E)** Papilomatosis laríngea; resección con láser urgente

**PREGUNTA 2**

Una mujer de cincuenta y cinco años, fumadora de treinta paquetes-año, consulta por cambio de voz progresivo durante el último año. Refiere que su voz se ha vuelto muy grave y ronca. La laringoscopia muestra engrosamiento difuso bilateral de las cuerdas con aspecto gelatinoso. ¿Cuál es el diagnóstico y el tratamiento?

- A)** Nódulos vocales por abuso vocal; fonoterapia
- B)** Edema de Reinke por tabaquismo; cese del tabaquismo más cirugía de decorticación
- C)** Cáncer glótico; biopsia urgente y tratamiento oncológico
- D)** Laringitis crónica por reflujo; inhibidores de bomba de protones
- E)** Papilomatosis laríngea; resección con láser

**PREGUNTA 3**

Un paciente fue operado de bocio hace tres semanas y desde entonces tiene disfonía. La laringoscopia muestra la cuerda vocal izquierda inmóvil en posición paramediana. ¿Cuál es la causa más probable de la disfonía?

- A)** Edema laríngeo posoperatorio transitorio
- B)** Parálisis vocal izquierda por daño del nervio laríngeo recurrente izquierdo durante la cirugía
- C)** Hematoma del espacio paraglótico que comprime la cuerda vocal
- D)** Intubación traumática con granuloma de cuerda vocal
- E)** Parálisis vocal derecha por tracción del nervio durante la cirugía

**RESUMEN: DISFONÍAS CRÓNICAS**

La disfonía crónica se define como la alteración de la voz que persiste más de dos a tres semanas. El estudio siempre es mediante nasofibrolaringoscopia, que permite visualizar directamente las cuerdas vocales y las estructuras laríngeas. Las causas más importantes para el EUNACOM se clasifican en cuatro grupos. Primero, las lesiones benignas por abuso vocal: nódulos vocales, pólipos vocales y quistes de retención. Los nódulos aparecen en pares, simétricos en el borde libre de las cuerdas, frecuentes en profesores y cantantes; el tratamiento inicial es fonoterapia. Los pólipos son generalmente unilaterales, de mayor tamaño, requieren cirugía. Los quistes también son unilaterales y requieren cirugía. Segundo, el edema de Reinke, que ocurre en fumadores crónicos y produce una voz engrosada o masculinizada en mujeres. Es el edema del espacio de Reinke en la cuerda vocal. El tratamiento es dejar de fumar y cirugía de decorticación. Tercero, la parálisis vocal, que puede ser unilateral o bilateral. La parálisis unilateral produce disfonía y voz bitonal; la causa más frecuente es quirúrgica por daño del nervio laríngeo recurrente izquierdo, que es más largo y tiene mayor riesgo. La parálisis bilateral produce estridor y es emergencia de vía aérea. Cuarto, el papilomatosis laríngea por VPH tipos 6 y 11, que produce nódulos vegetantes en la laringe que recidivan frecuentemente y requieren resección repetida con láser. La laringitis crónica por reflejo gastroesofágico es también frecuente y produce disfonía matutina que mejora durante el día. El tratamiento es inhibidores de bomba de protones. En fumadores, la disfonía crónica siempre debe descartar cáncer de laringe mediante laringoscopia, que es el signo de alarma más importante.
